PriorGen

At least 4 ways to elicit priors. Only Betas?

PriorGen

At least 4 ways to elicit priors. Only Betas?
Based on the available literature the

1. **mean** value for sensitivity of a test is expected to be 0.90 and we can be 95% sure that it is >0.80.

PriorGen

At least 4 ways to elicit priors. Only Betas?
Based on the available literature the

1. **mean** value for sensitivity of a test is expected to be 0.90 and we can be 95% sure that it is >0.80.

2. **median** value for sensitivity of a test is expected to be 0.99 and we can be 95% sure that it is >0.90.

PriorGen

At least 4 ways to elicit priors. Only Betas?
Based on the available literature the

1. **mean** value for sensitivity of a test is expected to be 0.90 and we can be 95% sure that it is >0.80.

2. **median** value for sensitivity of a test is expected to be 0.99 and we can be 95% sure that it is >0.90.

3. mode for **prevalence** of a test is expected to be 0.01 and we can be 70% sure that it is <0.05.

PriorGen

At least 4 ways to elicit priors. Only Betas?
Based on the available literature the

1. **mean** value for sensitivity of a test is expected to be 0.90 and we can be 95% sure that it is >0.80.

2. **median** value for sensitivity of a test is expected to be 0.99 and we can be 95% sure that it is >0.90.

3. mode for **prevalence** of a test is expected to be 0.01 and we can be 70% sure that it is <0.05.

- Stat exercise: i). Compute the mean and variance of 1,2,3 priors. ii) Plot the priors.

Extracises

Extracises

- Multiple experts have an opinion. What to do? (7562 6680)

- Programming exercise. Tweak the **findbeta()** function, return α,β and plot the Beta prior directly.
